

INTEGRATION

Finastra Fusion UltraData

Overview

With OpCon's Finastra Fusion UltraData integration, you'll get faster, more accurate processing from the UltraData platform while spending less time managing it. As a result, you'll give your IT team time back to focus on strategic and growth initiatives instead of day-to-day operational tasks—saving you money, time, and resources.

Use Cases

- 1 Automate and speed up ACH processing**
OpCon works with UltraData, so you can reduce errors and job failures by eliminating up to 90% of the manual, back-office IT work associated with ACH processing.
- 2 Enhance monitoring and reporting capabilities**
With the OpCon Vision dashboard, you can view all your automated workflows in one place and closely monitor and measure your SLAs. OpCon's event-driven triggers notify you right away if something's off track, so you can act quickly and meet your SLAs.
- 3 Enable automation independence for non-IT departments**
With OpCon Self-Service, you can give those outside of IT the power to run their processes at the click of a button—reducing the burden on your IT staff. Self-service buttons enhance operational efficiency by providing accessible automation to end-users—enabling secure, safe, and consistent automation across your organization.
- 4 Manage third-party vendor files**
In addition to the UltraData core processes you can run with OpCon, you can also automate business-critical processes involving third-party file management. For example, if one of your batch processes requires files from a vendor, OpCon can watch for them, retrieve them when they're ready, and drop them where they need to be.
- 5 Streamline processes outside of the core**
With tools like OpCon RPA, you can streamline all of your processes inside and outside the core. From scraping data off websites to logging into websites to download files to extracting information from Excel, OpCon RPA can close the remaining manual gaps in your workflows, enabling end-to-end automation.

6 Utilize sophisticated notifications and escalating alerts

Not only can OpCon monitor practically any log file, it can also send intelligent alerts for proactive measures when certain events happen like potential processing issues. You can customize notifications for any department or business process. OpCon can also escalate events, so the appropriate people receive alerts and acknowledge them. You can send alerts via email, text, business communication apps, or other methods.

7 Leverage cloud-hosted option with built-in disaster recovery

Hosting OpCon in the cloud ensures your applications and data are protected by utilizing encryption at rest whenever possible. It takes care of and secures all your backups, so normal operations resume quickly in the event of a disaster.

Key Features

Single point of control for your UltraData environment

Event management

Automated scheduling for UltraData batch jobs

File transfer automation

Complex/holiday scheduling capabilities

File arrival monitoring
