

INTEGRATION

Fiserv Signature

Overview

The Fiserv Signature platform offers a wide range of functionalities to support business operations, and when paired with OpCon's IBM i agent, you can multiply your organization's operational efficiency and improve your productivity, customer service, and competitive advantage. OpCon offers world-class automation, robotic process automation (RPA), integration across multiple systems, and a single point of control.

Use Cases

- 1 Integrate multiple platforms and applications**
Unite your tools, applications, legacy systems, and the cloud within a single interface. For example, integrate IBM i, Windows, SQL, and VMWare tasks and easily view the workflow. OpCon can make virtually all applications and environments accessible with a connector, command, web service, or API.
- 2 Allow end users to initiate processes without IT intervention**
OpCon enables you to quickly automate workflows to reduce the burden on your IT staff. Most tasks can be automated in low code without scripting to save time and resources. And through OpCon's Self-Service feature, business users can trigger automated processes at the click of a button.
- 3 Perform nightly jobs for multiple databases at the same time**
Instead of running nightly jobs separately for multiple databases in a single partition, employ parallel processing. You can have the same script running for multiple databases within a machine at the same time, so you can get a lot more work done in a lot less time.
- 4 Manage the stops or breaks in your workflow**
Create greater efficiency by letting OpCon handle messages and interruptions. Manage stops or breaks to balance something or acknowledge that data is correct. Have OpCon examine messages, verify that values are correct, and then give the appropriate response in the right order. If one of your jobs fails, have it restart where it left off. OpCon provides the tools needed to give you step-level restart.

5 Be notified of hidden errors

The report scanning tool can detect errors within a job by reading job log reports. It'll save you time and effort by finding errors that exist within a job that IBM sees as a normally completed job.

6 View job output for jobs

Eliminate the need to log into the i system or use shortcuts to see job failures. Easily view job output in the OpCon interface with right-click options. OpCon will send an email to notify you when there's a failure, which includes error code information and an attachment giving you the full report of a job log.

Key Features

	Automated job scheduling		Message management		Event management
	Continuous monitoring of system services		Object authority management		IBM i LSAM software maintenance
	Capture job definitions		File transfer automation		File arrival monitoring
	Fully automated Restricted Mode automation		Data capture with value testing/response		Job tracking and queuing
	Multi-step job scripting with stop-level restart		Export/import agent configuration data		Communication formats and security
	Dynamic variables represented by token		Operator replay with self-adapting scrips		Automatically scan spool files for specific values and create response rules for actions
